Review Report

In this review, the authors have sought to discuss inhalation anesthetics and its cardiovascular protective effectiveness, to broad the knowledge of how the inhalation anesthetics benefits the process to prevent cardiovascular ischemia, arrhythmias, reperfusion injury, and cardiac revascularization formation. The authors clearly stated that despite the fact that inhalation anesthetics exhibit distinct beneficial effect on cardiovascular disease by modulating many signaling pathway, there are still some concerns leaving on undesirable hemodynamic effect brought with inhalation anesthetics application.

Given the round and detailed discussion and the narration of this review, I believe it merits publication.

I have read this submission. I believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard.
