Review Report

The article is well written, the work is relevant, and the framework is appropriate.

The only consideration that I see is that the author in the pages 5 and 6 use the pronoun "I", and could be shown as a indirect form, using less the author's points of view and more what the science is showing, I would only change the "I".

In page 6, the author shows his hypothesis, saying "my hypothesis", I think this could substituted by using, for example "the hypothesis of this work", making the working less personal and more scientific.

Even with this small considerations, the article do not lose its value, and my verdicts is: (A)

We have read this submission. We believe that we have an appropriate level of expertise to confirm that it is of an acceptable scientific standard.
