Review Report

The paper screen Muslim population of Sri Lanka suffering from metabolic syndrome as a major problem for some chronic diseases such as obesity, hypertension, T2DM.

The methodology of paper is OK but the number of sample is small.

The presentation of result is not good and ignored the correlation between the measured parameters.

The discussion is poor and focused only on the comparison with the other studies without interpretation of the obtained results.

The references is not enough to cover the subject, especially there is a huge updated publication in the subject of the paper.

I have read this submission. I believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard, however I have significant reservations, as outlined above.
