Review Report

This manuscript make a comprehensive statement on the incidence,risk factors classification,clinical presentation, pathology,diagnosis and treatment recommendations for bladder adenocarcinoma. Some points are listed below for further improvement.

- It is recommended that the page3 24line“In addition, it shows a male predominance, with the sex ratio of males to females 2.7:1.5 ” be placed behind the 4 line“with urachal carcinoma representing 0.34% to 0.7%.2” the incidence of this disease is more abundant.
- The prognosis of bladder adenocarcinoma is an important issue.It is highly suggested that this content be described separately at the end of the text.

I have read this submission. I believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard, however I have significant reservations, as outlined above.
